

GC Dry Mouth Gel provides comfort to individuals who may be experiencing difficulty eating, speaking or suffering from dry mouth. Dry mouth is a common problem often seen in individuals with impaired production of saliva from medications, radiation treatment or diseases that can damage the salivary glands, for example.

## Other Possible Causes of Dry Mouth Include:

- Insufficient water intake
- Dehydration from physical activity
- Mouth breathing or smoking
- Dehydration from high intake of caffeine or alcohol (e.g., coffee, energy drinks and soft drinks)

## GC Dry Mouth Gel Can be Applied Easily

Express a generous amount of GC Dry Mouth Gel from the tube onto a clean finger or tongue. Smear the gel over the buccal and lingual surfaces of teeth and oral mucosal tissues. GC Dry Mouth Gel should be applied anytime during the day as needed or at night before bed after normal tooth brushing.

## GC Dry Mouth Gel - Great for Denture Wearers

GC Dry Mouth Gel can be used under mandibular full dentures as a tissue protectant and lubricant.

When placed inside a maxillary full denture, it may replace the cohesive retention effect which is normally gained from saliva. However, it does not replace the need for a separate denture fixative. GC Dry Mouth Gel does not stain or damage acrylic, chrome-cobalt or other denture base materials.

## MI Paste™ & MI Paste Plus™

MI Paste greatly reduces tooth sensitivity by protecting dental nerve endings, forming a buffer against plaque and restoring minerals that keep teeth strong. MI Paste Plus offers the same great benefits of regular MI Paste, enhanced with a form of fluoride to further promote remineralization and prevent teeth from caries development.

MI Paste Plus is not recommended for children age 6 and under.
